Towards hybridity? Nationality, ownership, and governance of news agencies in Europe.

Abstract

This article explores the nationality, ownership and governance of news agencies in Europe and suggests that we need to re-think and problematize the categories previously used when studying these. Drawing on recent data from a pan-European study, the article suggests that the concept of hybridity could be applied to analyzing news agencies’ nationality, ownership and governance. It reviews the concept through different fields: (1) cultural studies; (2) organizational studies, and (3) political-regime and media-system studies, each of these contributing to a complementary understanding of the concept of hybridity. It concludes that: (1) the previously fixed categories of national and international news agencies have become more integrated; (2) the different ownership forms of national news agencies have been partly amalgamated in terms of both owners and clients, and (3) ownership category alone cannot determine whether governance is democratic or non-democratic, so we also need to look at governance. The article suggests that, by using the concept of hybridity when analyzing news agencies, we are able to see crossing boundaries of earlier ideal types and even developing possible alternative approaches to studying news agencies in future.

Key words: news agencies, nationality, ownership, governance, hybridity, cooperative, private, state, public, Europe, organizations

Introduction
Witschge et al. (2019) have recently argued that the field of journalism studies has overused the concept of hybridity, and that it is time to move towards new concepts. They (Witschge et al., 2019, p. 654) give several examples of how what they call a hybrid turn in journalism studies has given rise to the use of new blurred categories, for example those of produsagers (Bruns, 2006), of media cultures (Hermida and Young, 2017), of forms of production (Papacharissi, 2015), and of political campaigning (Wells et al., 2016). However, so far the hybrid turn has not yet become evident in news-agency studies, and in this article I argue the opposite: that in order to be able to develop fresh approaches to news-agency studies in Europe we need to re-explore the concept of hybridity, drawing on not just one but three different strands of literature: (1) cultural studies; (2) organizational studies, and (3) political-regime and media-system studies.

This is important because the existence and continuity of national news agencies – since these are the oldest electronic media organizations in Europe – has been taken for granted for a very long time. There is a national news agency in every European country except Estonia, Ireland and Iceland, and they still play a significant role as intermediary organizations that provide their service to most media in the country concerned, and also – through their own networks – beyond it. However, as a recent report (Rantanen et al., 2019a) shows, many of them are confronting a crisis that has threatened their viability and very existence. Their changing role or potential disappearance is crucial to any analysis of media transformation, but news agencies remain under-researched when compared with many other media, especially social media, and more updated research with alternative study approaches is needed.

Furthermore, the theorization of news agencies has often been based on fixed, taken-for-granted “either/or” categories concerning their nationality, ownership, operations and markets. In this article I argue that these categories no longer entirely hold (if they ever did) and that news agencies today are more complex and
more mixed, both within and across these categories. I use the results from a recent pan-European study (Rantanen et al., 2019a) to problematize these categories and to put forward an argument about the usefulness of the concept of hybridity in analyzing news agencies in future.

Previous research on news agencies

A good deal of academic research has focused on international news agencies and on the globalization of news (see, for example, Boyd-Barrett, 1980; Boyd-Barrett and Palmer, 1980; Alleyne and Wagner, 1993; Boyd-Barrett and Rantanen, 1997; Giffard and Rivenburgh, 2000; Paterson, 2011). There is also an overemphasis on historical research. Much of the scarce research on news agencies is nowadays the work of media historians (see, for example, Renaud, 1985; Silberstein-Loeb, 2014; Vyslozil with Wittenberg, 2014; Tworek, 2019).

There has been a distinct preference for research on privately owned agencies, resulting in one-sidedness and in an ignoring of state ownership in Europe (except – but this is now outdated – Rantanen and Boyd-Barrett, 2005). Finally, there is very little research on European national agencies in general. The last studies of European national news agencies date from 2000 (Boyd-Barrett, 2000; Boyd-Barrett and Rantanen, 2000).

Conceptual framework

If empirical research on national news agencies has recently been lacking, the absence of theoretical and/or conceptual thinking has also been very striking. Either they have not been theorized at all or, when they have been theorized, this has been with the use of concepts that mainly concentrate on the relationship between international and national news organizations, that is emphasizing how dependent
national agencies are on international agencies for their exchange of news, and that this relationship is uneven (see, for example, Meyer, 1989). The division between international and national news agencies, where the former have been viewed more negatively and the latter as often unproblematically positive, has often taken attention away from the study of national agencies and presented the division between international and national as the most significant factor, as if other factors were insignificant. The two categories of international and national have not always been problematized and thus have been taken for granted.

The other categorization taken for granted is that of ownership. In the past, news agencies have traditionally been categorized and divided in terms of their ownership into: (1) private; (2) cooperative, and (3) state (UNESCO, 1953). A recent report suggests a new categorization of news-agency ownership into: (1) private; (2) state, and (3) public (Rantanen et al., 2019a). The ideal form of ownership of news agencies has always been a contested issue among both academics and practitioners. It has not helped that news agencies are absent from so many studies of media ownership (see, for example, Djankov, McLiesh and Nenova, 2001; Noam, 2016; Dragomir, 2018), of cultural economy and creative industries (De Beukelaer and Spence, 2019) and of media systems (Hallin and Mancini, 2004) – this although national news agencies are to be found in most countries around the world. Almost nothing has been written about news-agency governance since the UNESCO study in 1953 (UNESCO, 1953).

Another dimension of discussions around media ownership, and perhaps particularly news-agency ownership, is polarization. There are those who argue that either private or cooperative ownership guarantees the most objective news content, while government ownership is seen as the enemy of a free flow of news (see, for example, Champagne, 2005). The private, and especially the cooperative, ownership models have been seen as ideal models for guaranteeing, as a former director of the Associated Press (AP) put it, “true and unbiased” news (Cooper, 1942), while the state ownership model has not received similar praise. Leading
international news agencies Reuters and AP have both crusaded for private or cooperative ownership forms as a guarantee of the freedom of news (Mant, 1939; Cooper, 1942). This discourse is still often shared by both academics and news-agency executives (Rantanen and Kelly, 2019).

The new data (Rantanen et al, 2019a) calls for new academic research and alternative concepts. In this article I suggest that the concept of hybridity could be useful when studying news agencies. The reason for doing this is that the present “container model”, where news agencies are separated from each other solely on the basis of their nationality and ownership form, is in my view unhelpful when attempting to analyze changing news agency operations. Because ownership is viewed so ideologically – often “us against them” (Rantanen and Kelly, 2019), using fixed categories of nationality and/or ownership prevents us from seeing what all news agencies share, irrespective of their nationality and/or ownership form.

Here I use the concept of hybridity originating from the natural sciences, where it denotes “the offspring of two animals or plants of different specie” (Hybrid, n. and adj., 2019). The concept has been “borrowed” by cultural, journalism and post-colonial studies, political science, organizational, management and even warfare studies – to mention just a few – but not used in news-agency studies. Anheier and Krlev (2014, p. 1395) call hybridity an “umbrella concept that can be applied to a multitude of organizational phenomena.” I argue here that by using the concept of hybridity when analyzing news agencies, we are able to see what has not been seen before, crossing the rigid boundaries of earlier ideal types and even developing alternative approaches to studying news agencies. In the following section, I first review how the concept of hybridity has been defined in some of the fields I consider relevant.

1. The concept of hybridity in cultural and post-colonial studies
In cultural studies, Garcia-Canclini (1989) has described Latin American countries as hybrid cultures where “previously separate cultural systems mingle, symbolic interactions are de-territorialized, and impure genres rule” (Kraidy, 1999, p. 460). As Kraidy goes on to write (p. 460), the usefulness of Garcia-Canclini’s approach lies in how he considers local/global interactions as a “hybridity” of both process and product, rejecting the polarity between global (production and dissemination) and local (reception) aspects of mass-mediated culture (my emphasis). As Kraidy (2002, p. 317) also observes, hybridity needs to be understood as a “communicative practice constitutive of, and constituted by, socio-political and economic arrangements.”

In post-colonial studies, Bhabha (1994) is acknowledged as having introduced the concept of hybridity in order to analyze cultures and identities, their “impurity” and “mixed-ness.” He uses the term hybridity rather than hybridization, insisting that hybridity is an ongoing process, since cultures, rather than being solid and authentic, are unexpected, messy, hybrid and fortuitous. The starting point is never a “pure” culture, but that cultures are born after the hybridity process rather than existing before it (Huddart, 2006, pp. 1, 4, 5, 99).

Garcia-Canclini, Bhabha and Kraidy all define the concept of hybridity in the contexts of culture, media and identity. They all emphasize the non-polarity of cultural forms and their interconnectivity and “impurity.” They, like many cultural and globalization theorists (Rantanen, 2019b), have argued against an unambiguous division between the international and the national, and proposed new levels of analysis including the local. Their approach is rather general, and not necessarily useful when studying news agencies except when discussing their nationality. This is why I need to bring in the notion of hybridity as found in the study of organizations.

2. The concept of hybridity in organizational studies
The concept of hybridity (or hybridization, both terms are used) first became popular in this field with reference to third-sector, non-profit, voluntary, civil-society and NGO organizations that were difficult to study because of their “fragmentation, fuzziness, and constant change” (Brandsen, van de Donk and Putters, 2005, p. 749). These organizations had different institutional logics, but often with a mission of societal change (Haigh and Hoffman, 2012, p. 127). Hybrid organizations can most broadly be defined as “heterogeneous arrangements, characterized by mixtures of pure and incongruous origins, (ideal) types, 'cultures,' 'coordination mechanisms,' 'rationalities,' or 'action logics’” (Brandsen, Van de Donk and Putters, 2005, p. 750) that mix the characteristics of state, market and civil society. Hybrid organizations may be anything from purely governmental agencies to commercial firms, and can both function like “customer oriented and efficient firms and/or carry out intrinsically public tasks” (Kickert, 2001, p. 148).

Many authors (Minkoff, 2002; Brandsen, Van de Donk and Putters, 2005; Smith 2010) argue that hybridity reflects the restructuring role of the state in a financial crisis and how non-profit organizations respond to this in an uncertain environment. While earlier studies of organizations divided them by categories of ownership, funding and mode of social control, Billis (2010, pp. 48-49) writes that if ownership is taken as the primary category it leaves third-sector organizations excluded from any categorization, and that this is why it has become equally important to study governance (Cornforth and Spear, 2010, p. 73). Hybrid organizations can be seen as presenting complex governance challenges (Smith, 2010), and more recent research has emphasized the need for multi-layered analysis (Brandsen and Karré, 2011), including measurement of performance, innovation, regulation, and sustainability (Skelcher and Smith, 2017).

These studies show us that the concept of hybrid organizations has become established in this field of study, where they are seen as new types of organizations with mixed ownership and governance. These studies help us to understand that all organizations do not fit into categories based solely on ownership, but that we also need to look at other factors that define them. However, in order to understand
media organizations, and specifically news agencies, I also need to review the concepts of hybrid regimes and of hybrid media systems.

3. The concepts of a hybrid regime and a hybrid media system

The relationship between a political and a media system has been seen as unquestioned. The definition of a media system usually implies its dependence on a specific political system (Engesser and Franzetti, 2011, p. 277). According to Almond and Powell (1966, pp. 3–4), this interdependence means that when the properties of one component in a system change, all other components also change and the system as a whole is affected. In their and in media-system models, the degree of state control or intervention plays a key role (Blumler and Gurevitch, 1995; Hallin and Mancini, 2004), which then directly or indirectly determines how democratic the system is. (Rantanen, 2013, p. 260).

The idea of a media system emerged from political science, which classified political systems and regimes into democratic or non-democratic categories. Diamond (2002, p. 33) argues that these classificatory schemes have reached their end and now “impose an uneasy order on an untidy empirical world.” Diamond puts forward an argument that regimes have become more and more “mixed,” and that “the black and white distinctions between democratic and non-democratic regimes have now turned into different shades of grey.” He recalls (2002, p. 33) research that recognizes these differences:

As democracies differ among themselves in significant ways and degrees, so do contemporary authoritarian regimes, and if we are to understand the contemporary dynamics, causes, limits, and possibilities of regime change (including possible future democratization), we must understand the different, and in some respects new, types of authoritarian rule.
Chadwick (2013) argues that it is not only regimes but media systems that are also becoming more hybrid (p. 15). In a hybrid system, according to Chadwick (2013, pp. 4-5), “hybrid thinking rejects simple dichotomies, nudging us away from ‘either/or’ patterns of thought and toward ‘not only but also’ patterns of thought” (p. 4). The “simultaneous integration and fragmentation” (Chadwick, 2013, p. 15) happens not only between different media sectors but also inside them. Both observations are useful to this article because boundary fetishism, as Chadwick points out, is not unknown in the social sciences. As he writes, “attempts to control, police, and redraw boundaries, and the power struggles that criss-cross domains are important defining features of contemporary political communication” (Chadwick, 2013, p. 15).

News agencies, as part of a media system, are also influenced by these changes in organizational structure, as this article explores. As Tsuriel et al. (2019, p. 5) write, in a media system we may find blurred boundaries between roles, identities and norms, and changes in organizational structure and news production.

The concept of hybridity can be used in regime and media-system studies in three different ways: to challenge (1) the set-in-stone division between democratic and undemocratic regimes, or (2) the separation of older and newer media logics, or (3) to argue for a blurring of boundaries between the system’s key components, such as news agencies, including organizational structures. This is why I propose that the concept of hybridity in regime and media-system studies may help us to understand how news agencies have changed.

Research questions and materials

In this article I use the concept of hybridity to study the nationality, ownership and governance of national news agencies in Europe. I concentrate specifically on ownership, including nationality and governance, but not on their operations or markets, which have been studied separately and using the concept of diversity (Surm, 2019; Jääskeläinen and Yanatma, 2019).
My research question here is:

To what extent, if any, is the concept of hybridity manifested in studying news agencies with respect to the categories of national and international, to forms of ownership, and to forms of governance?

This article draws empirically on data collected as part of the pan-European research project on The Future of National News Agencies in Europe, conducted in collaboration with the European Alliance of News Agencies (EANA) and based at the London School of Economics and Political Science (LSE) (Rantanen et al., 2019a). EANA has 32 national news agencies as members, with one agency – except in the case of the Baltic states – as an institutional member from each European country, as well as from Azerbaijan, Russia, Turkey and Ukraine (About EANA, 2020). A survey was conducted in 2018, in which 25 of the 32 EANA member agencies participated (their CEOs or other members of their senior management filled out the questionnaire). Due to the possibility of sensitive business information being raised, all participants were assured of full confidentiality and anonymity. This is why it is not possible to identify individual news agencies. This article is based largely on an analysis of the survey results, but also uses, when possible, publicly available data on news agency ownership (Rantanen et al., 2019a).

Discussion and results

1. The categories of national and international agencies

Taking Garcia-Canclini’s concept of hybridity to reject the polarity between the global and the national, one could use it to challenge the concept of nationality of national news agencies. One of the longest-standing divisions drawn by news-agency research is between “international” and “national” agencies (UNESCO, 1953). This
division goes back to the 19th century, when three European news agencies, Havas, Reuter, and Wolff, established a news cartel by dividing the world’s news market among themselves. These three international agencies were the only ones that could operate outside their own home countries, while national agencies could only operate in their own countries (see, for example, Rantanen, 2009).

Since the 19th century, it has been argued that every country should have its own national news agency, which would serve national interests. News agencies were largely a European invention and, apart from the Associated Press (AP) in the USA, most of the early national news agencies were founded in Europe in the late 19th and early 20th centuries (Rantanen, 2009). It has long been taken for granted that national news agencies have a “nationality,” as their names reflect – for example, Norsk Telegrambyrå (Norwegian Telegraph Agency, NTB), or Agence Télégraphique Suisse/Schweizerische Depeschenagentur (Swiss Telegraph Agency, SDA) – and that the nationality and/or location is a crucial factor in analyzing their influence (Tunstall, 1977). This assumes that ownership, location of headquarters and language(s) always coincide. It has also been assumed that the ownership of national news agencies, even if they operate internationally, should be in domestic hands (Rantanen, 2019).

However, this is not necessarily any longer the case. Most national news agencies in Europe have long provided their services in countries other than their own. Their decisions to provide a service outside their home countries have been prompted by language, capital flows (clients interested in their news service), new avenues of profitability, or by geopolitical factors (for example, historical links, neighboring location of countries) (Bhat, 2018). We have also witnessed the first signs of change in terms of national agencies turning their operations into regional ones and of ownership shifting into a neighboring country in terms both of operation and of ownership. The Estonian Telegraph Agency (ETA), founded in 1920, went bankrupt in 2003 and for the first time since it was founded there was no national news agency in Estonia. The Baltic News Service (BNS), established in 1991 in Moscow
to cover all the Baltic countries, was bought by the Finnish media corporation Alma Media in 1998 and operated as a national agency in Estonia. Alma Media sold it in 2014 to an Estonian businessman. Today, there are two branches: BNS Estonia and BNS Lithuania (Lauk and Einmann, 2019, p. 3). In Switzerland, in 2018, the national news agency Schweizerische Depeschenagentur/ Agence télégraphique suisse/ Agenzia telegrafica svizzera (SDA-ATS) was merged with Keystone AG, a picture agency, which was 50-per cent owned by the Austrian national news agency Austria Presse Agentur (APA). After the merger APA became 30-per cent owner of the merged company (SDA und Keystone fusionieren, NZZ, 2018).

National news agencies also have international aspirations (Table 1). According to Rantanen et al. (2019a), 96 per cent of news-agency executives agreed with the argument that a national news agency is vital to national media and should be kept alive, but at the same time 88 per cent agreed strongly that national news agencies should pursue more international collaboration (Bhat, 2018).

Figure 1 here.

It is still possible to divide news agencies into the two categories of international and national if we consider their size, and the number of their correspondents and clients, as Vyzlosil and Sturm (2019) have suggested. But news agencies have always been both international and national, since the raison d’être of their activities has been news transmission across national borders, even when national news agencies’ activities were restricted by the international news cartel. What we see now is that national ownership has in a few cases turned into regional ownership beyond the borders of the nation-state where the agency is located. We also see the aspiration of most national news agencies in Europe to operate outside their home countries.

2. Forms of ownership
According to Grossi and Thomasson (2015, p. 605), hybrid organizations are those that borrow components and logics from three different sectors: public, private and non-profit. Since, as far as I know, there are no studies that investigate news agencies as hybrid organizations in terms of their ownership, in this section we concentrate on how news agencies have become hybrid both within and across categories of ownership.

Table 1 here

There have been changes in all categories of ownership, but even more within different ownership forms. The co-operative ownership form has practically disappeared in Europe, as has the *non-profit-making* corporation (UNESCO, 1953, p. 43) without shareholders or other commercial forms of ownership. In the survey results from 2017, nine news agencies defined themselves as private shareholder companies (see Table 2) where the majority of shares are owned by shareholders or by one shareholder (Rantanen et al., 2019a. p. 5). As Jääskeläinen and Yanatma (2019a, p. 5) write, the “agencies turned from cost-sharing cooperatives into profit-seeking media services companies, taking risks and aiming to create a return on capital for the owners. This has fundamentally changed the capabilities needed by the firms.”

The state-ownership category has become much more diversified than previously thought (Rantanen and Boyd-Barrett, 2005). Half of agencies in the state-ownership category could be defined in terms of the state being the sole owner, while for the other half the ownership structure consisted of different combinations (Bhat, 2018) where the state was one of the shareholders. The state needs the market and cannot maintain its ownership without private revenues except in those agencies.
that give their products to customers free of charge. State-owned agencies are also
vulnerable and not always able to survive, especially in small markets (Lauk and
Einmann, 2019).

Vyslozil and Wittenberg (2014, p. 30) suggest a new category of public (service)
news agencies. A public agency may be financially supported by the state, while not
owned or controlled by the state but by parliament or another type of public
organization (Rantanen et al., 2019a, p. 7). In 2017, six European agencies
reported themselves as public news agencies (Table 2). This was why the
researchers decided to define a new category of public agency, as distinct from that
of state agency, although this category was not included in their original survey
questions.

However, even the concept of a publicly owned agency is difficult to define. For
example, AFP, which was previously defined as a state agency, can now be defined
as a public agency. It was founded under the joint control of the French government
and the French press in 1944, under the terms of a law that would ensure the
agency’s financial stability and independence from the state (UNESCO, 1953, p. 36).
As Juntunen and Nieminen (2019, p. 4) write, “the sui generis status given to the
agency makes it neither a state-owned nor a commercial entity, which differentiates
AFP both from other global news agencies operating purely on a commercial basis
and from those operating under the direct control of the governments that finance
them.”

One of the features defining news agencies is that their owners are also their clients.
When defining ownership only through the owners, we often forget that all news
agencies need clients. This is true especially of the private ones, since their
existence is based on profitability (Jääskelainen and Yamatna, 2019b), but it would
be impossible for any agency to survive losing all its clients, even if they were non-
paying clients. All news agencies are to a certain extent dependent on publicly
funded institutions as their clients, as Table 3 shows. The state may be an important
source of income from subscription fees: 13 news agencies reported that around 40 percent of their total revenue came from public or political institutions (Bhat, 2018). In short, private ownership may coexist with dependence on state financial support and/or on a public-service broadcaster as a client (Yle jatkaa STT: n asiakkaana, 2017; Finnish gov’t approves €1.5m subsidy for struggling news agency STT, 2018), as happened in Finland.

Figure 2 here.

When we study the ownership of national news agencies in Europe, it is clearly seen that categorization by “pure” ownership forms is over. Mixed ownership forms cross different categories of ownership, especially when we take into account clients with a double role as owners. Private ownership also loses its “purity” through state funding of private agencies and through public service broadcasting companies being their clients. In short, most agencies combine the organizational logics of three different sectors: public, private and state – either through their owners or through their clients.

3. Forms of governance

One of the issues raised by studies of hybrid organizations is governance, which is often neglected by news agency studies that concentrate only on ownership. The challenge for hybrid organizations, as Jason (2013, p. 137) writes, is to combine the different logics of government bureaucracies, business firms and non-profit associations. Since we need to determine whether news agencies can be called hybrid organizations in terms of their governance, we first need to find out who the decision makers are in these organizations.

When it comes to the profitability of media-owned companies, as shown earlier, some of their clients play a double role as both owners and clients. Within the
category of private news agencies, the ownership of many agencies has shifted to a
structure in which a single media company or a small group of media companies
owns a controlling proportion of shares (Rantanen et al., 2019a, p. 5).
Simultaneously, their governance has shifted from a cooperative to a corporate
ownership form, where the largest shareholders make major decisions, in place of
cooperative governance that was based, at least in principle, on more democratic
decision-making.

Figure 3 here

While in private agencies the owners always appoint the board, in state and public
news agencies it was previously parliament and/or the state. However, in the 2019
study (Rantanen et al., 2019a), there were shown to also be many agencies that did
not fit either of these models (Bhat, 2018), again problematizing the clear-cut
divisions between different forms of governance. In most cases, even where
government or state representatives are involved in board appointments, their
influence is only through an intermediary institution like a council or a foundation. It
is also limited by the involvement of other industry or civil-society representation
aimed at counterbalancing government or state influence (Rantanen et al., 2019a, p.
7).

In some publicly owned news agencies, board members are appointed by
parliament, while in others they are appointed through other processes. In some
cases, for example, employees may nominate a board member, while in others
councils are appointed by the President, parliament, experts or government
representatives (Rantanen et al., 2019a, p. 7). The main aim of these strategies
seems to be the creation of an “arms-length” relationship between the state or
government and the board appointments process. For example, some news
agencies make board appointments through a public media foundation, while others
appoint their boards through a council consisting in its turn of representatives of
parliament. There are other strategies that also attempt to balance the power
equations in the appointments process (Rantanen et al., 2019a, p. 7).

Publicly owned and financed news agencies are also vulnerable to political and financial pressures from outside. Their constitution is not set in stone, but can change with a new governmental majority. Some of the agencies founded as public news agencies in Central and Eastern Europe (CEE) after Communism collapsed now seem to be under increasing government control. For example, following the passage of a new media law (Opinion of the Commissioner for Human Rights, 2011) in Hungary in 2010, the Hungarian news agency MTI, as a part of the public-service media, was placed under the new National Media Council. While critics see this as a new centralized news-production system that threatens the public media's diversity and pluralism, the Hungarian government claims that the new system is more cost-effective and efficient, while still safeguarding the autonomy of Hungary's public media (Public service media, n.d.). In short, news agencies seldom have more safeguards from government control than a national PSB company in the same country.

When it comes to the state's role as legislator and regulator, there are special laws on the status of state-owned agencies. But it is not only the nation-state that legislates for news agencies in the European Union. As Juntunen and Nieminen (2019, p. 6) point out, EU state-aid rules now set the framework for state funding in member countries and this also affects state funding of national news agencies (recent decisions have concerned AFP in France, EFE in Spain and STT in Finland, which all had received state funding). The EU state-aid rules are another example of cross-border hybridity, where a “national” institution is also governed by a regional organization.

Governance of national news agencies in Europe predominantly reflects their ownership. However, when one looks more closely at what is happening inside and outside these organizations, one starts to see more similarities across ownership
forms. The conflicts that arise from attempts to combine the different logics of state, private companies, and public organizations are not easy to solve and the boundary problems inside and outside organizations come to the surface as a result of their different interests. We start to see mixed forms of governance where, as Diamond (2002, p. 33) suggests, “the black and white have now turned into different shades of grey.”

Conclusion

In this article I have argued that we still need the concept of hybridity in order to better understand the crisis that national news agencies in Europe are currently experiencing. Using the concept of hybridity as defined in (1) cultural studies, (2) organizational studies and (3) political-regime and media-system studies, I have explored three fixed categories earlier used in news agency studies: (1) nationality, (2) ownership, and (3) governance of national news agencies in Europe. I have argued, on the basis of data from a recent survey and since they are the oldest electronic media organizations in Europe, that:

- The previously fixed categories of national and international news agencies may have become more integrated.
- Different ownership forms of national news agencies in Europe may have been partly amalgamated through their owners and clients.
- Ownership category may not be the only factor determining whether governance is democratic or non-democratic.

But why did we need to review here three sets of literature on hybridity rather than using only one? I would argue that each approach complements the others and makes an additional contribution. A cultural studies approach clearly focuses on cross-national border activities that are not seen as important in media-systems or organizational-studies approaches. When we study news agencies, even national agencies, we simply cannot completely separate their international from their national activities. We are now seeing the emergence of the new regional news...
agencies that are no longer in national ownership, and all agencies in the EU are
also subject to supra-national legislation. This further complicates the governance of
news agencies, which need to combine different organizational logics not only inside
their country of location but also outside it. Neither a media-system nor an
organizational-studies approach alone would have been able to help us to
understand this change.

The concept of hybridity as used in organizational studies contributes to changing
the level of this study: rather than studying cultures and systems, it becomes
possible to concentrate on exploring whether a concept of hybridity can be used in
the study of news agencies as organizations. News agencies have not hitherto been
seen as hybrid organizations in terms of their ownership and governance, but it still
becomes possible to argue that their ownership is mixed, even if they are not
traditional third-sector organizations. They do combine the different logics of state,
business and non-profit (public service) organizations through their ownership,
governance and clients.

When it comes to hybrid-regime and media-system studies, we again learn the
importance of interdependence and the end of ‘purity’ when using the concept of
fixed categories. News agencies can be understood as systems even if they are not
often studied in the framework of a national media system. As Boyd-Barret and
Rantanen (2000, p. 87) write,

> a system comprises interdependent parts, and this is what we find with news
agencies: they use each other as sources, they sell to each other, they forge
alliances with one another, they sell services to client media and use client media as
sources of information.

When we combine the concept of a system with the study of news agencies, we can
see that while the system approach very much emphasizes structures, fixed-ness
and stability, but when cultural and organization studies use the concept of hybridity
they stress informality, mixed-ness and change. News agencies are trying to integrate new and old media logics inside their organizations, but their attempts to change are restricted by their own existing ownership and governance structures. This may be one of the key issues in their attempts to overcome the crisis. As Chadwick et al. (2016, p. 285) write,

> power in the hybrid media system is exercised by those who are successfully able to create, tap, or steer information flows in ways that suit their goals and in ways that modify, enable, or disable the agency of others, across and between a range of older and newer media settings.

One of the key issues for political scientists and media-systems scholars has been the identification of more and less democratic regimes and systems. This article has the much less ambitious aim of trying to identify components that make news agencies an arguably important but neglected element of national media systems. Even by using data that is currently available, one can conclude that all ownership and governance structures of news agencies have their strengths and weaknesses, and that there is no one ideal model that fits all. As Juntunen and Nieminen (2019, p. 11) write, “mechanisms for assessing the value of national news agencies to society must be complemented by strict regulations on firewalls that effectively guarantee their autonomy from any outside interference, either political or commercial.” This is also an internal issue for news agencies: how to find and establish new forms of governance that help to make them more inclusive and diversified to be able to establish new relationships with their existing and new clients based on “mutual benefit and sustainability” (Haigh and Hoffman, 2012, p. 127), but also serve their role for society as provider of trustworthy news.

The data available to this article cannot help to answer the question of how news agencies’ news production and reporting have changed – a topic for another study. It has only used the most recent research on news agencies to argue that hybridity is a useful concept and that rather than leaving it behind we should further explore it.
At a time when news agencies are in crisis, as some of those in Europe are, academic researchers are invited to shift some of their attention from the newest media to news agencies. Even if these are often seen as ‘old media’, their continuing role in providing news to both old and new media, even while finally themselves struggling, needs further research, both conceptual and empirical.

**Funding**

The author disclosed receipt of the following financial support for the research, authorship and/or publication of this article: This research was funded by the Media Research Foundation, Finland; Jyllands-Posten Foundation, Denmark; LSE Knowledge Exchange and Impact (KEI) Fund, UK; Department of Media and Communications at LSE, UK.

The author would like to thank Ramnath Bhat, Anthony Kelly and Jean Morris for their contribution and Ramnath Bhat, Atte Jääskeläinen, and Richard Stupart for their role in collecting and collating data used in this article.

The claims listed below are often made in discussions about national news agencies. Please indicate your level of agreement with the following claims:

- A national news agency is vital to national media and should be kept alive
- A national news agency should have more international collaboration
- A national news agency provides services of high value for societies, and therefore should be subsidized by the state
- In the future, if there is no national news agency, new services will emerge to replace it
- The nationality of a news agency is not seen as important, as long as it provides the news that clients want in appropriate languages
- A national news agency should be funded in similar ways to public service broadcasting news
- The state should have its own news agency
