

## Web Appendix for “Urban Land Use Fragmentation and Human Wellbeing”

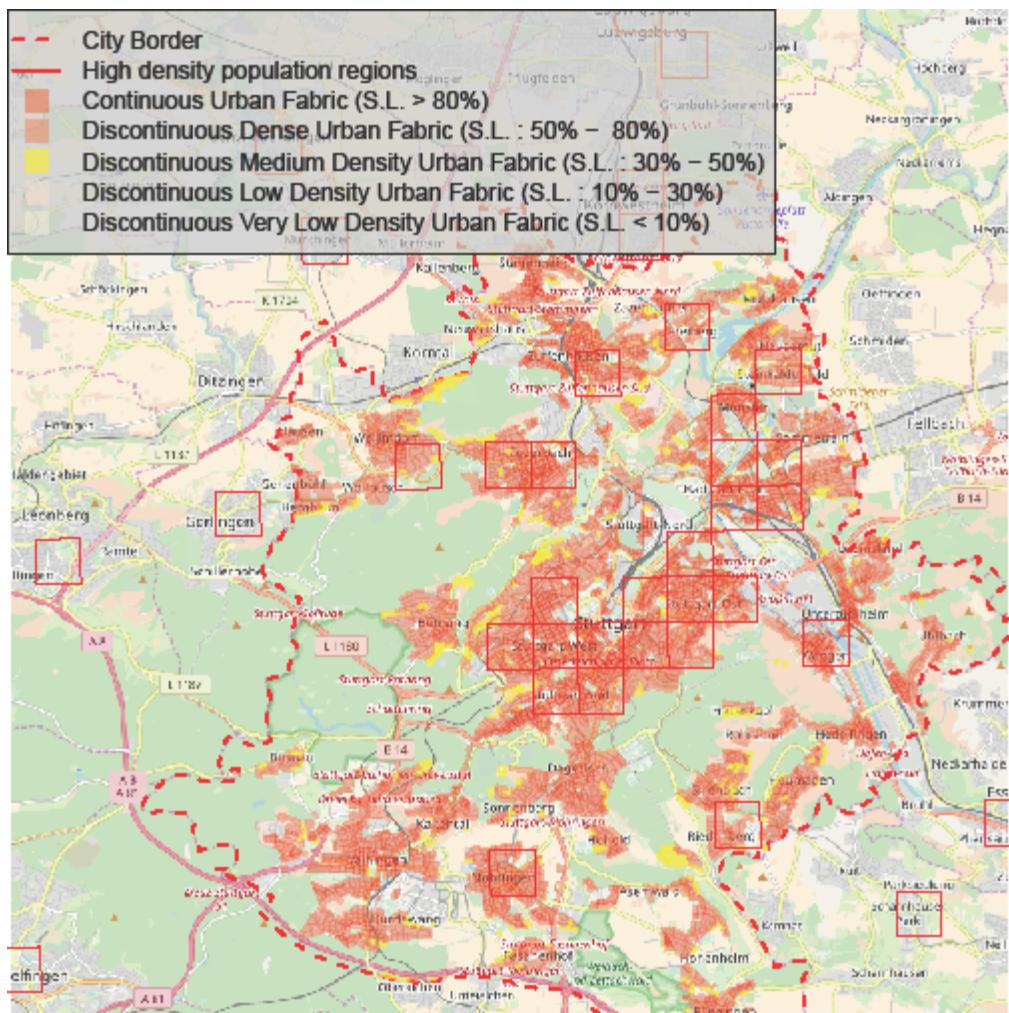

### Figures

*Figure W1a: Distribution of Different Types of Urban Fabric in Bonn, Germany*

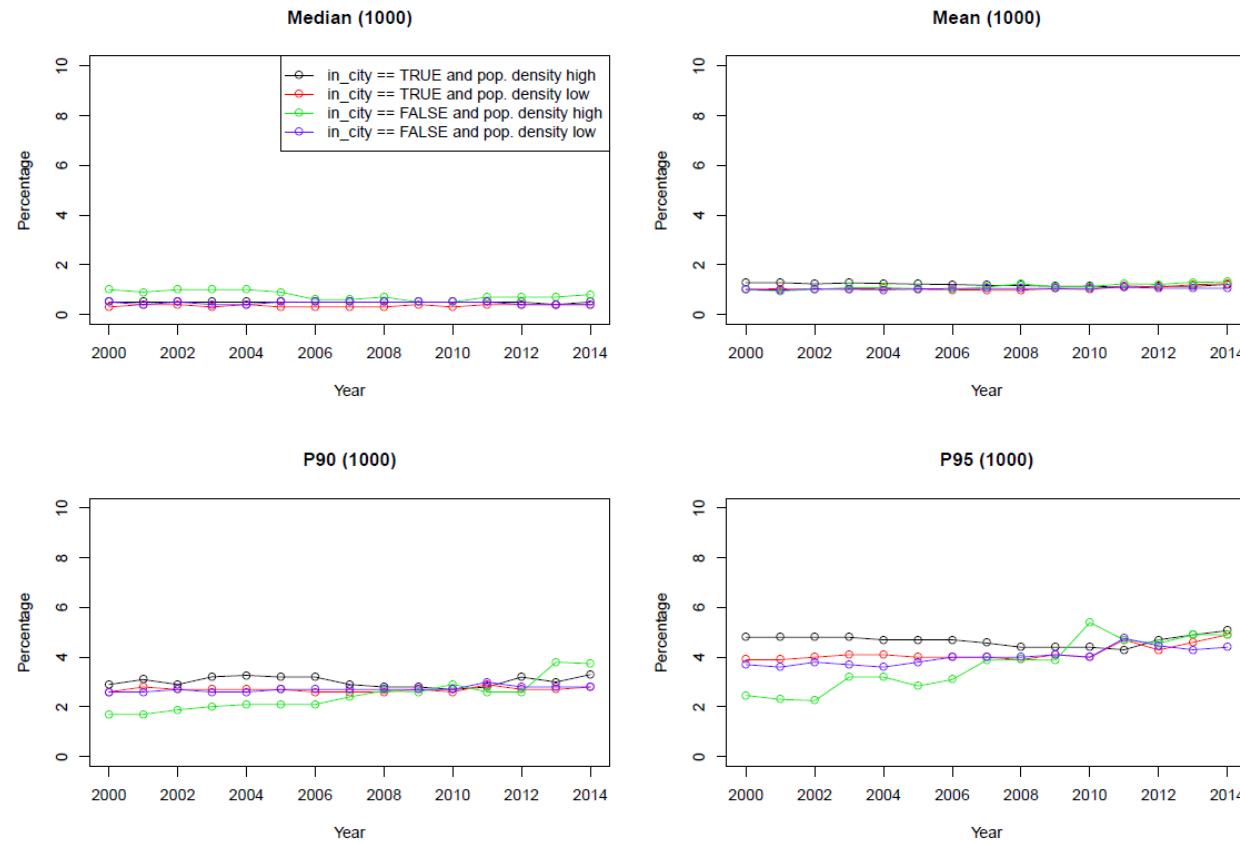

**Source:** European Urban Atlas, Bonn, 2006, own calculations

Figure W1b: Distribution of Different Types of Urban Fabric in Stuttgart, Germany

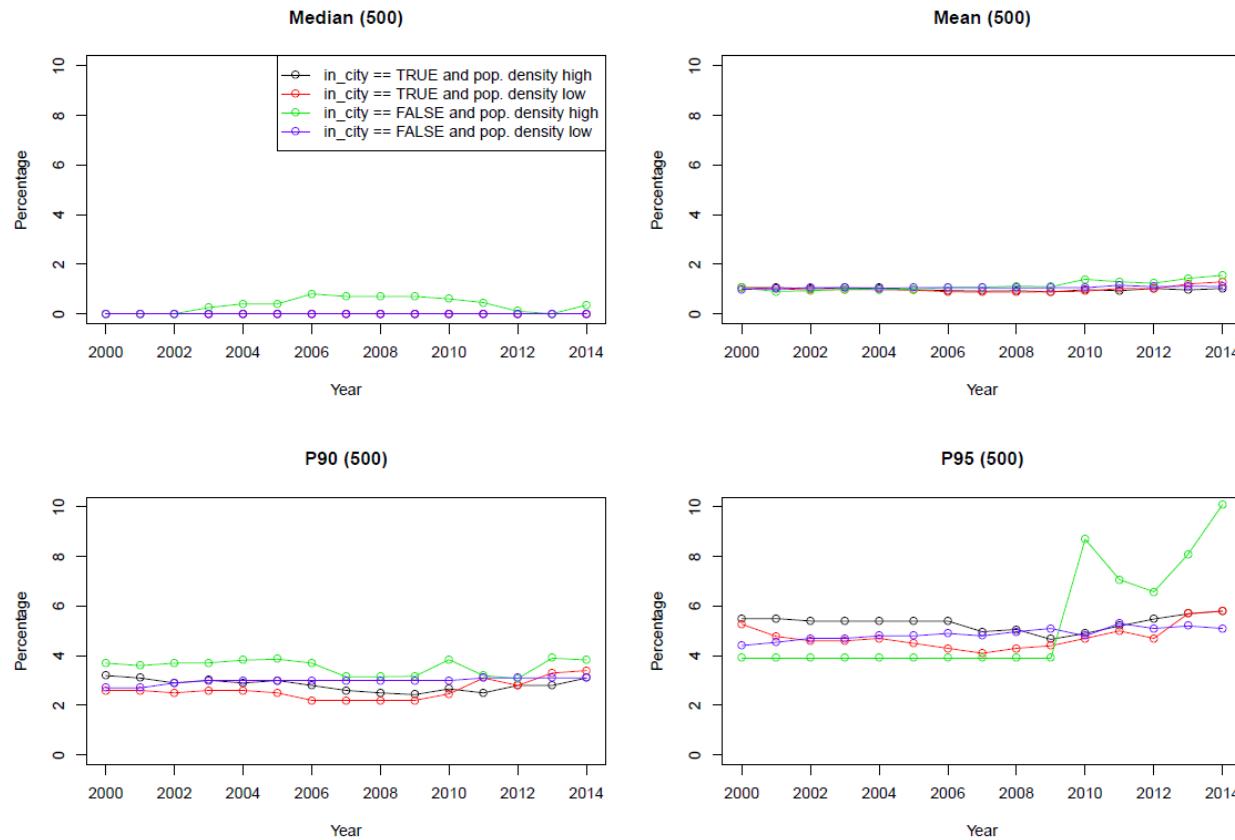

Source: European Urban Atlas, Stuttgart, 2006, own calculations

*Figure W2a: Change in Land Use by Household (Treatment Radius of 1000 Metres)*

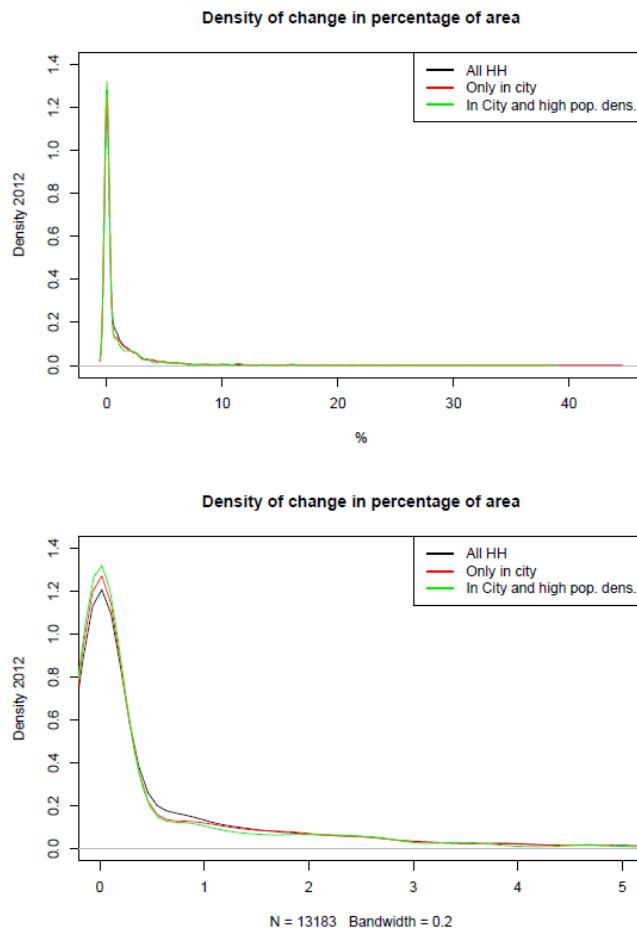

**Note:** The figure plots percentage changes (mean, median, and selected percentiles) in land use between 2006 and 2012 within a 1,000 metres radius around households over the observation period, by population density (that is, whether a household is located in an area which has, respectively, a population density greater or lower than the mean Census population density of the city). For example, for 2002, the figure shows the percentage changes in land use between 2006 and 2012 within a 1,000 metres radius around all households in 2002.

*Figure W2b: Change in Land Use by Household (Treatment Radius of 500 Metres)*

**Note:** The figure replicates Figure W2a using a 500 instead of a 1,000 metres radius.

Figure W2c: Density of Change by Household (Treatment Radius of 1000 Metres)

**Note:** The figure shows for all households in 2012 density plots for percentage changes in land use between 2006 and 2012 within a 1,000 (lower sub-figure) and 500 metres radius (higher sub-figure), respectively for all households (including households in the hinterlands), households within cities' administrative boundaries (excluding households in the hinterlands, i.e. our baseline specification), and households within cities' administrative boundaries and within areas that have a population density greater than the mean Census population density of the city.

## Tables

*Table W1a: Descriptive Statistics – Outcome and Controls*

	Mean	Minimum	Maximum	Observations
<i>Outcome</i>				
Life Satisfaction	7.0776 (1.8071)	0	10	34,256
<i>Controls</i>				
Age	48.0497 (17.0803)	18	98	34,256
Is Female	0.5370 (0.4986)	0	1	34,256

*Robust standard errors clustered at household level in parentheses*

\*\*\*  $p < 0.01$ , \*\*  $p < 0.05$ , \*  $p < 0.1$

**Notes:** Each estimate comes from a separate regression of Equation 1. The outcome is *life satisfaction* on a 0/10 scale. The treatment radius is 500 metres. The census is the mean number of residents per square kilometre (which is about 5,908), as defined by the Federal Statistical Office's 2011 Microcensus. All regressions include city and year fixed effects and a constant. All figures are rounded to four decimal places. See Section 2 for variable definitions and descriptive statistics.

**Sources:** SOEP, 2000-2014, individuals aged 17 or above; EUA, 2006, 35 major German cities with inhabitants equal to or greater than 100,000; own calculations.

\*\*\*  $p < 0.01$ , \*\*  $p < 0.05$ , \*  $p < 0.1$

**Notes:** The outcome is *life satisfaction* on a 0/10 scale. The treatment radius is 1,000 metres. The census is the mean number of residents per square kilometre (which is about 5,908), as defined by the Federal Statistical Office's 2011 Microcensus. All regressions include city and year fixed effects and a constant. All figures are rounded to four decimal places. See Section 2 for variable definitions and descriptive statistics.

**Sources:** SOEP, 2000-2014, individuals aged 17 or above; EUA, 2006, 35 major German cities with inhabitants equal to or greater than 100,000; own calculations.

*Robust standard errors clustered at household level in parentheses*

\*\*\*  $p < 0.01$ , \*\*  $p < 0.05$ , \*  $p < 0.1$

**Notes:** Every coefficient estimate comes from a separate regression of Equation 1. The dependent variable is *life satisfaction* on a 0/10 scale. The treatment radius is 1,000 metres. The census is the mean number of residents per square kilometre (which is about 5,908 in our estimation sample), as defined by the Federal Statistical Office's 2011 Microcensus. All regressions include city and year fixed effects and a constant. All figures are rounded to four decimal places. See Section 2 for variable definitions and descriptive statistics.

**Sources:** SOEP, 2000-2014, individuals aged 17 or above; EUA, 2006, 35 major German cities with inhabitants equal to or greater than 100,000; own calculations.

*Robust standard errors clustered at household level in parentheses*

\*\*\*  $p < 0.01$ , \*\*  $p < 0.05$ , \*  $p < 0.1$

**Notes:** Every coefficient estimate comes from a mixed effects model based on separate regressions of Equation 1. The dependent variable is *life satisfaction* on a 0/10 scale. The treatment radius is 1,000 metres. The census is the mean number of residents per square kilometre (which is about 5,908 in our estimation sample), as defined by the Federal Statistical Office's 2011 Microcensus. All regressions include city fixed effects and a constant. All figures are rounded to four decimal places. See Section 2 for variable definitions and descriptive statistics.
