Results

- Traditional models of husband-wife communication are complicated in polygynous unions and there is no model for spousal communication in polygynous unions.
- Polygynous women are less likely to use FP than their monogamous counterparts but more likely to use it clandestinely.
- Declines in official or “public” polygyny may lead to a shift to unofficial polygyny; the need for FPP messaging that is relevant to men and women in polygynous unions is thus not decreasing.

Main Findings from Family Planning Poster Survey:

1) Of the 190 FP posters surveyed from sub-Saharan Africa, not a single poster includes polygynous unions.
2) Many posters emphasize spousal communication, but they are implicitly or explicitly monogamous in their messaging.

Why study posters?

- Posters are often first step in FP messaging, especially where literacy is low.
- High costs are invested in poster design and distribution.
- Durability and aesthetics means posters may outlast other forms of FP communication.

Conclusions

- Polygyny is not included in FP posters. This is at odds with the realities of persistently high levels of polygyny (official and unofficial).
- The role played by polygyny in the design and consumption of FP programs has been ignored.
- Conventional models of couples’ analysis (i.e. studying monogamous couples) may be inappropriate for researching polygynous unions.
- Polygynous unions should be specifically segmented and targeted by IEC materials.
- Ignoring the reality of polygyny in FP communication may impact the effectiveness of family planning campaigns in parts of sub-Saharan Africa with high rates of official and/or unofficial polygyny.
